

effeff Escape Route Technology

Escape door control terminal
Model 1385
A truly flexible design

ASSA ABLOY, the global leader
in door opening solutions

Escape door control terminal model 1385 – new functions, new technology

Modular design for greater flexibility

Whether it's a question of choosing the right switch programme or deciding on an operational control, the terminal 1385 offers users a high degree of flexibility. These terminals feature an attractive, comprehensive switch programme due to their problem-free integration into products by the electrical installation and building systems manufacturer Jung und Gira. Based on the 55 series system used by many switch manufacturers, they can also be integrated in other switch programmes.

When it comes to operational controls, planners and fitters can choose between the standard key switch model and operation with a keypad or a RFID module. In this new terminal range, essential characteristics are very much in the foreground. The control is already integrated into the emergency switch, meaning the basic model only requires a single installation box when operated by an external device. The user can fit up to three installation boxes as required.

Greater security and easy operation - every requirement catered for

effeff's established quality standards guarantee the terminal operates safely, but the Terminal 1385 offers additional features which further improve safety in the event of an emergency. Multi-tone sirens and an acoustic signal for the blind ensure that people are alerted to danger. They also make sure the route to the escape door can also be easily found by the visually impaired or if there is thick smoke. Our innovative LED lighting concept has proved its worth and is also used in the 1385. With LED lighting, the door status is also immediately clear to those suffering from colour blindness.

Setting up operation is also easier - configuration takes place centrally and no longer needs to be carried out via the sliding switch on each device. Basic configuration does not require a programming device. To make installation more convenient, modules are connected using ready-to-fit cables with pin-and-socket connectors. This also ensures mistakes are not made during installation.

Overview of product advantages:

- Modules of 1-3 switch boxes
- Integrated controls
- Different switch programmes available
- Integrated TS bus interface for building management systems – can be used with visualisation and voice communication
- Additional safety features - multi-tone siren and acoustic signal for the blind
- Easy operation
- Clear signals on LED strip
- Central configuration
- Easy installation
- A wide range of surveillance options

1 Anything is possible
- You are sure to find a suitable solution amongst the wide range of combination options we offer

2 Safer escape routes
with state-of-the-art technology.
